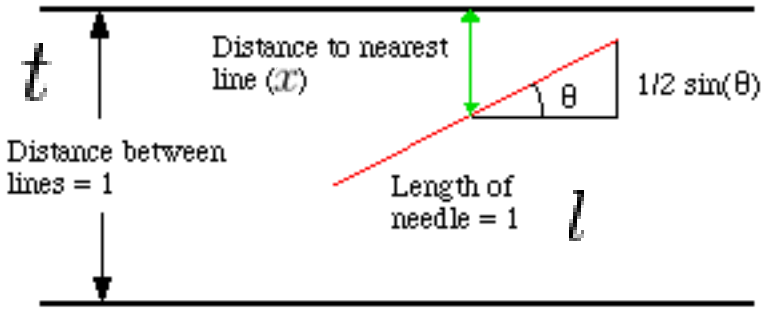
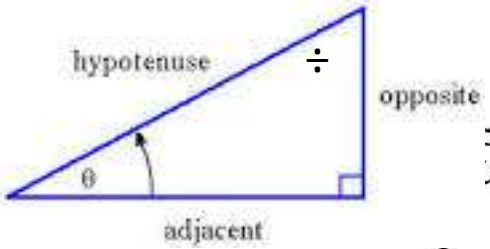
What is the Probability the Needle Crosses a Line?

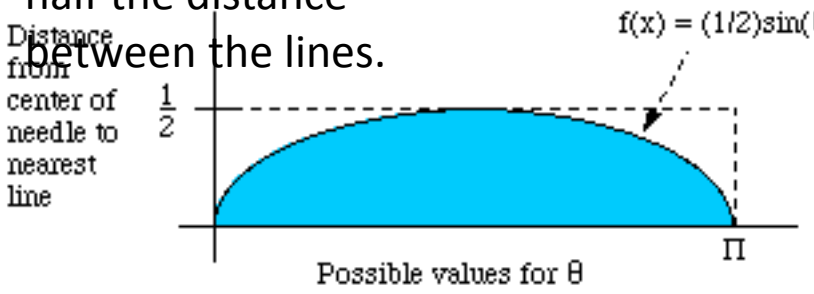
- The 1st Monte Carlo Experiment





The distance from the center to the closest line can never be more that half the distance between the lines.

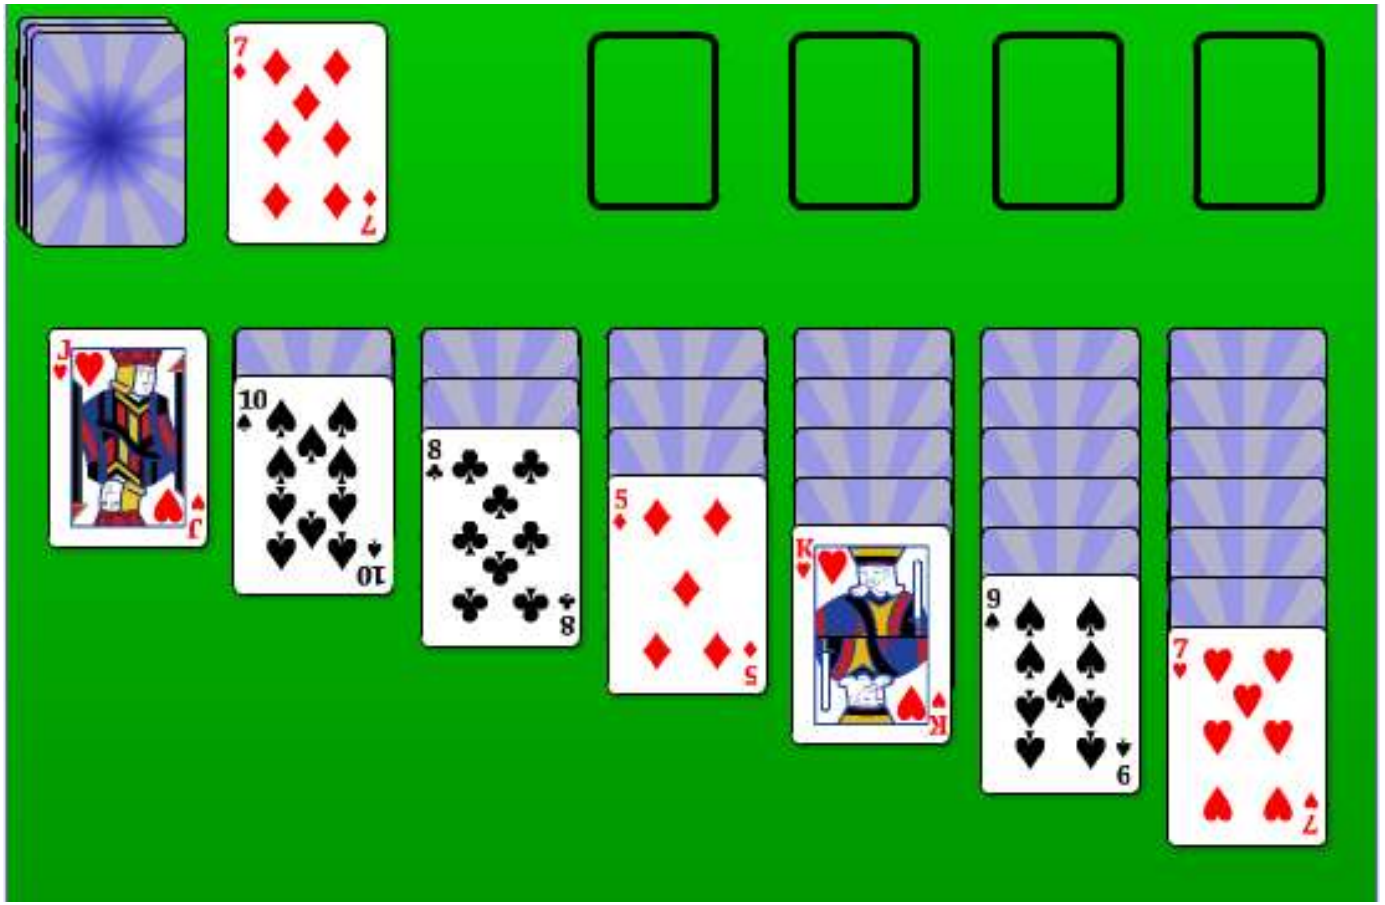
$$x \leq \frac{l}{2} \sin\theta.$$



2(n)/th ≈ π

Georges-Louis Leclerc, Comte de Buffon **(1777)**

Combinatorial Analysis
&
Theory of Probabilities



Metropolis Monte Carlo

1. Initial atom coordinates.
2. Random atom i moves by random displacement: ΔX_i, ΔY_i, and ΔZ_i
3. Calculate the change of potential energy ΔV corresponding to this displacement.
4. If $\Delta V < 0$ accept the new coordinates and go to step 2.
5. Otherwise, if $\Delta V \geq 0$, select a random number R in the range [0,1] and:
   A. If $e^{-\Delta V/kT} < R$ accept the new coordinates and go to step 2,
   B. If $e^{-\Delta V/kT} \geq R$ keep the original coordinates and go to step 2.

Dynamics of folded proteins

J. Andrew McCammon, Bruce R. Gelin & Martin Karplus

Department of Chemistry, Harvard University, Cambridge, Massachusetts 02138

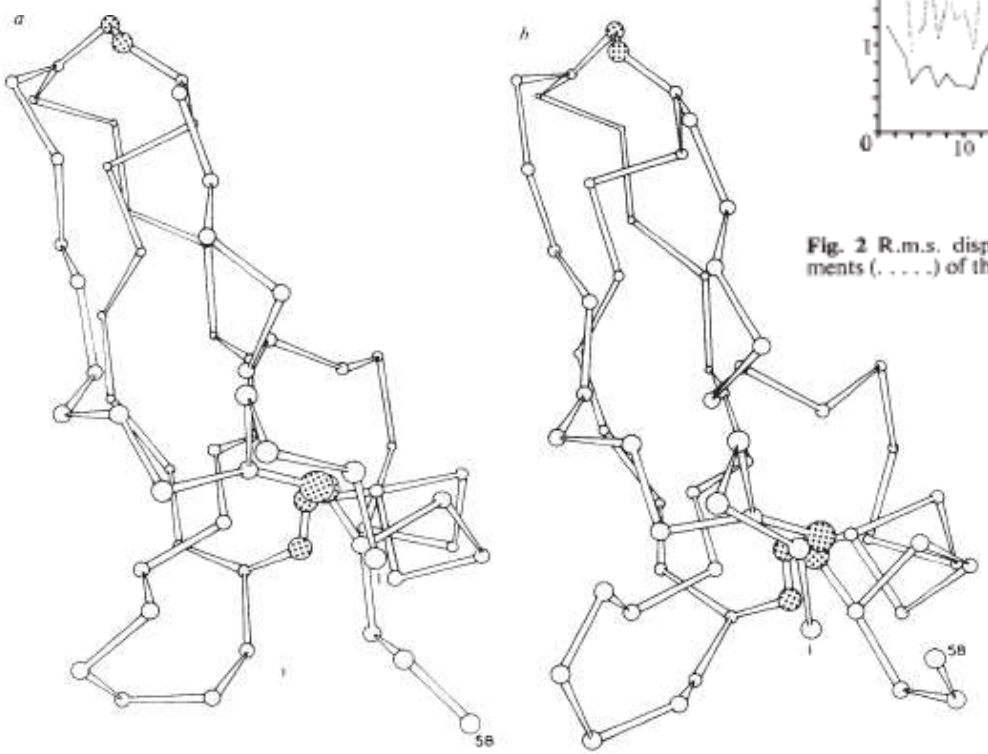

Fig. 1 The peptide backbone (α carbons) and disulphide bonds of PTI. *a*, X-ray structure[23]. *b*, Time evolved structure after 3.2 ps of dynamical simulation.

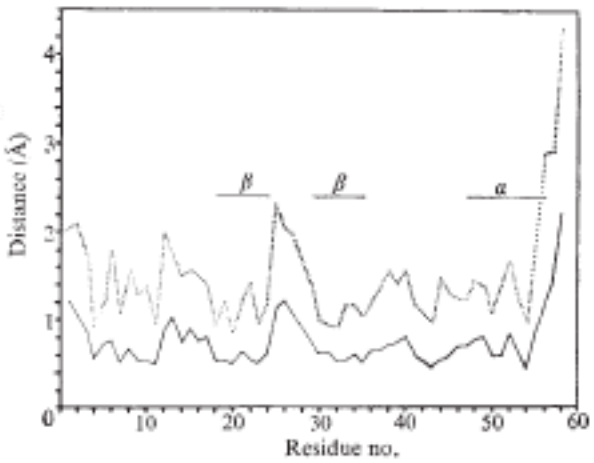

Fig. 2 R.m.s. displacements (———) and maximum displacements (. . . . .) of the α carbons, relative to the dynamical average structure.

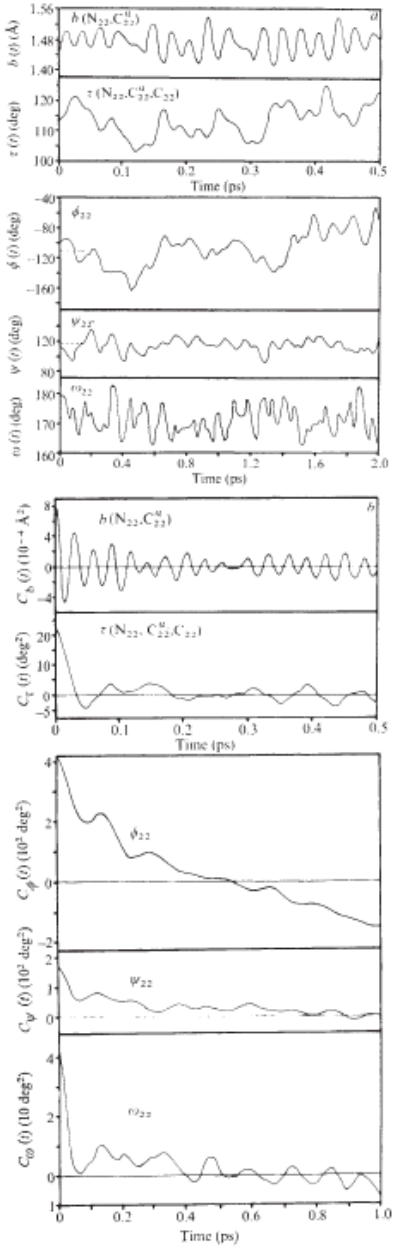

Fig. 3 *a*, Time development of selected Phe 22 internal coordinates; the initial time is 4.9 ps after the beginning of the dynamical simulation; average values are indicated by broken line segments. *b*, Time correlation functions for fluctuations of selected Phe 22 internal coordinates.

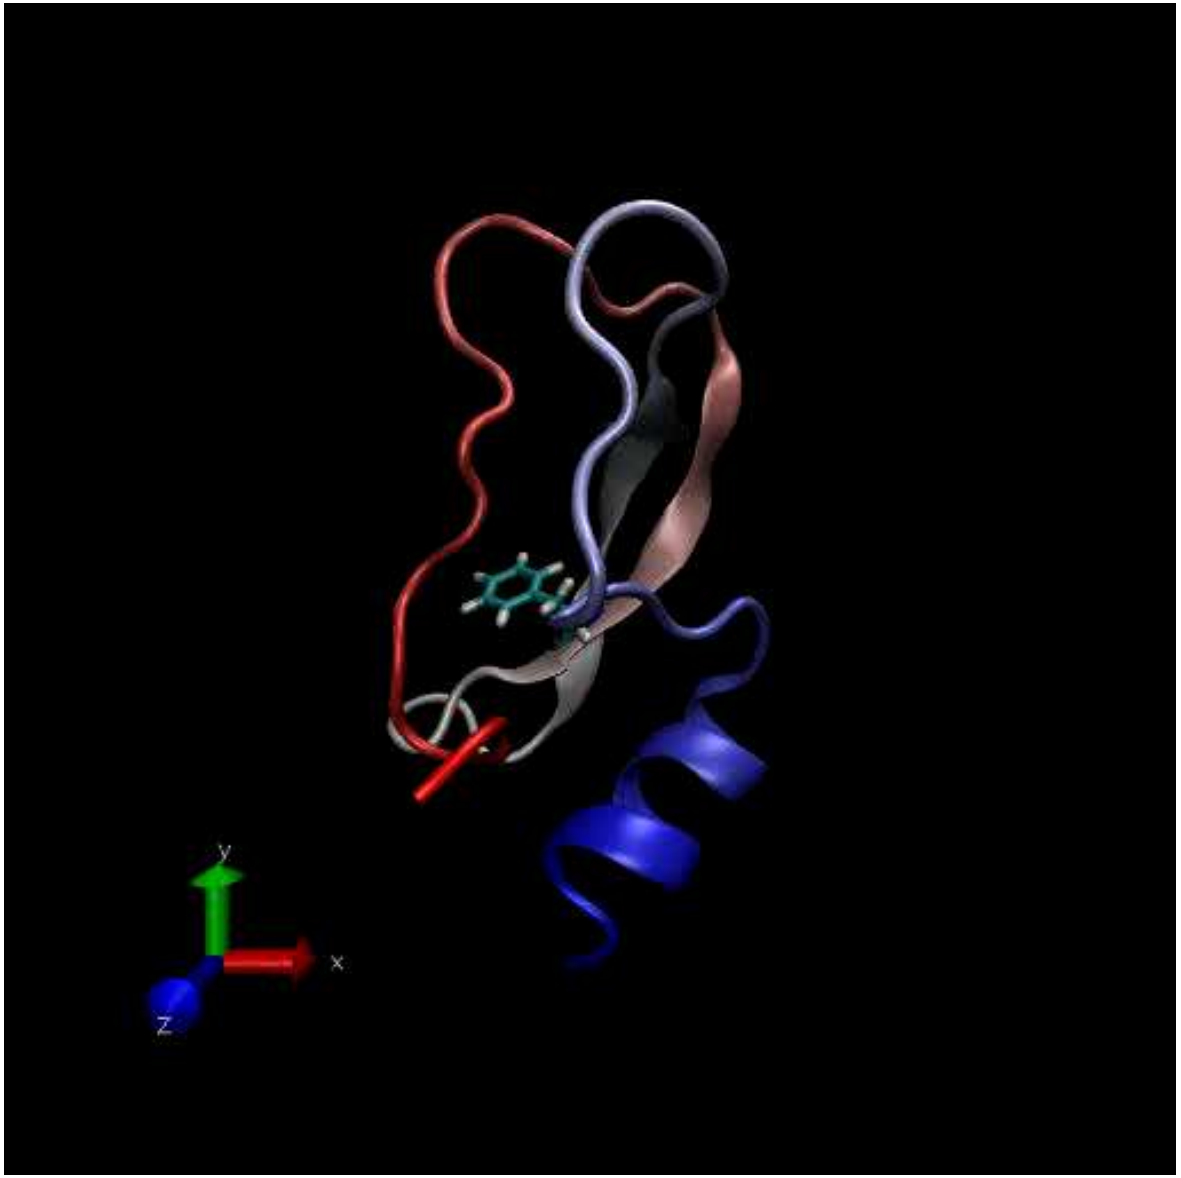
NMR of BPTI



Molecular dynamics simulations must pass through all possible states corresponding to the particular thermodynamic constraints

Molecular Dynamics

Statistical Mechanics

&

Classical Mechanics

Molecular Dynamics

- A computational method that calculates the time dependent behavior of a molecular system

- Provides detailed information on the fluctuations and conformational changes of ligands, proteins and nucleic acids

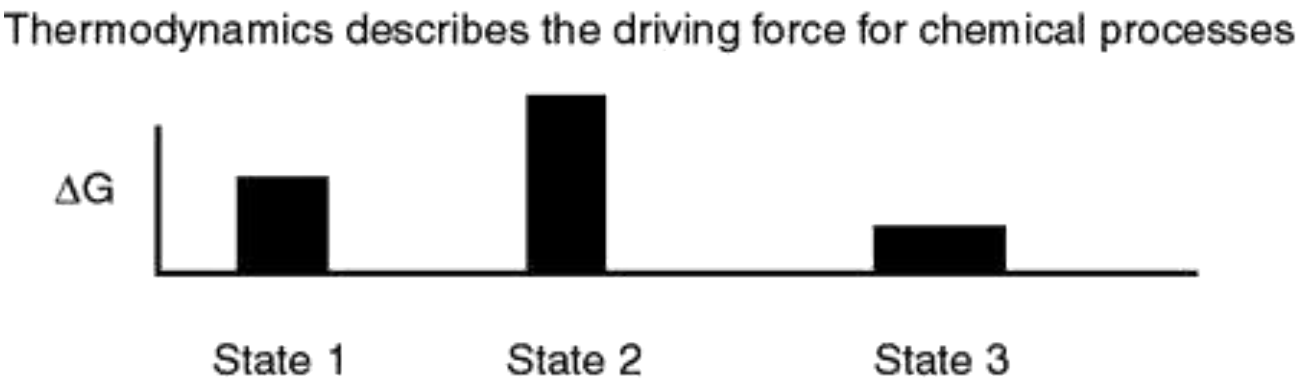
Definitions

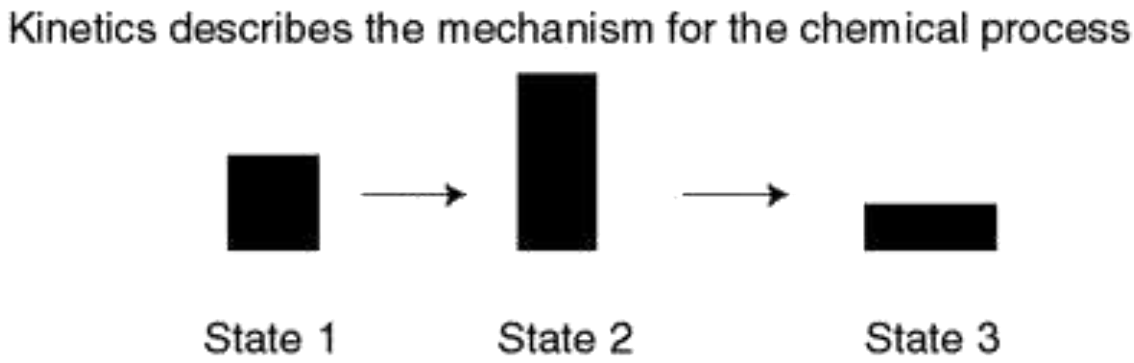
- *Thermodynamic state* is usually defined by the temperature (**T**), the pressure (**P**), and the number of particles (**N**).

- The *mechanical* or *microscopic state* is defined by the atomic positions, (**r**), and momenta, (**p**); these can also be considered as coordinates in a multidimensional space called **phase space**.

Molecular Dynamics

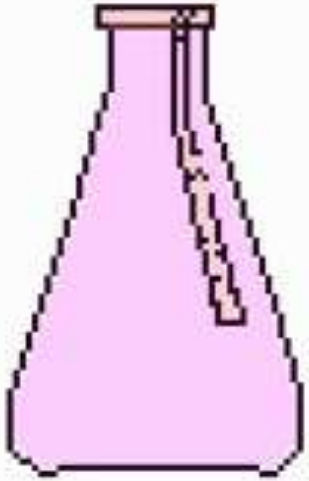
- An ensemble is a collection of all possible systems which have different microscopic states but have an identical macroscopic or thermodynamic state.





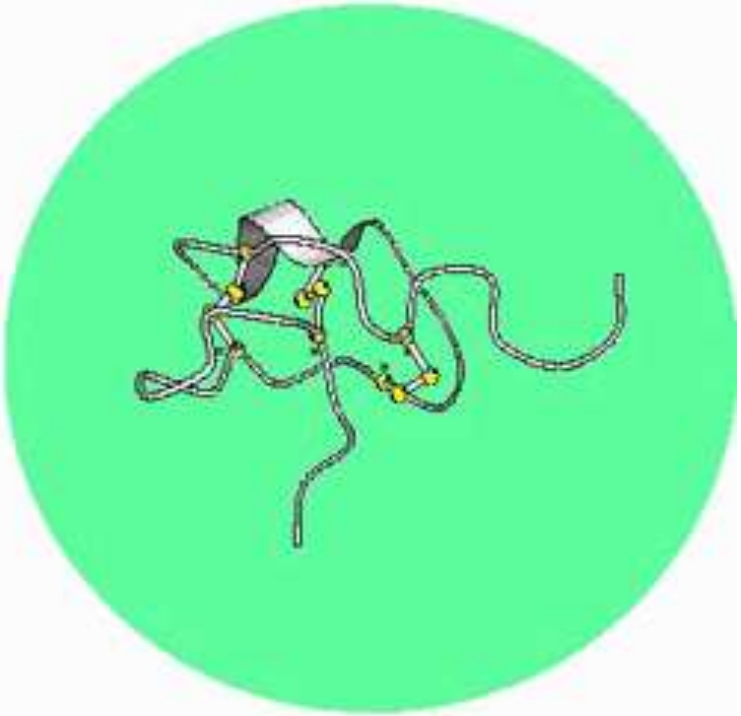
Molecular Dynamics

Experiment



Macroscopic

Molecular Simulation



Microscopic

Molecular Dynamics

- Statistical mechanics

  Ensemble average = Time average

$$\langle A \rangle_{ensemble} = \iint dp^N dr^N A\left(p^N, r^N\right) \rho\left(p^N, r^N\right)$$

$$\rho\left(p^N, r^N\right) = \frac{1}{Q} \exp\left[-H\left(p^N, r^N\right) / k_B T\right]$$

$$\langle A \rangle_{time} = \lim_{\tau \to \infty} \frac{1}{\tau} \int_{t=0}^{\tau} A\left(p^N(t), r^N(t)\right) dt \approx \frac{1}{M} \sum_{t=1}^{M} A\left(p^N, r^N\right) = \frac{R}{N_A}.$$

Th
pc
momenta (p) and the positions

Partition function the thermodynamic state variables (temperature and volume)

The average simulation time (t) is the number of time steps (M) in the simulation and the instantaneous value of A ($A(p^N,r^N)$)

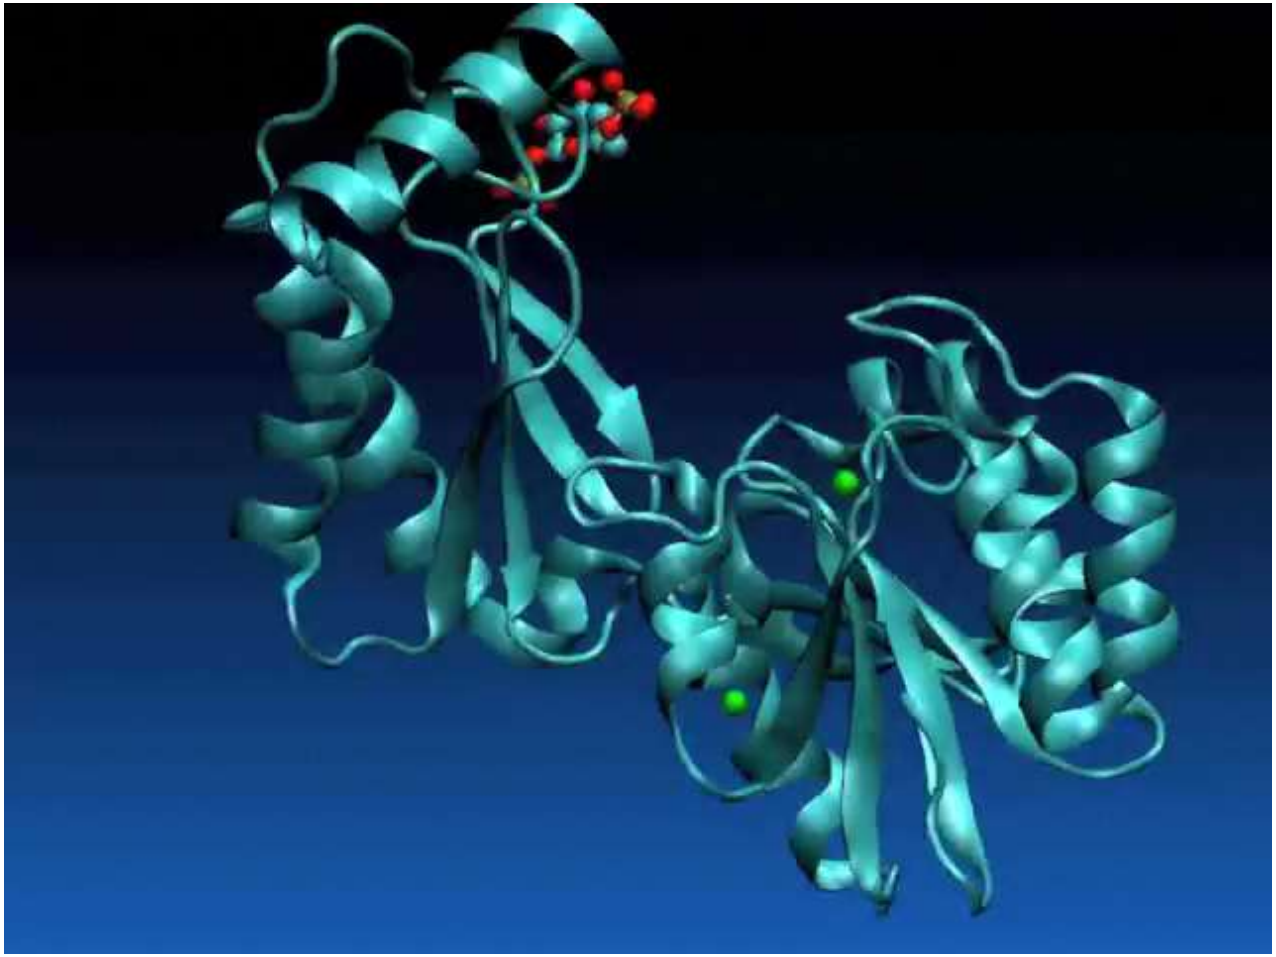
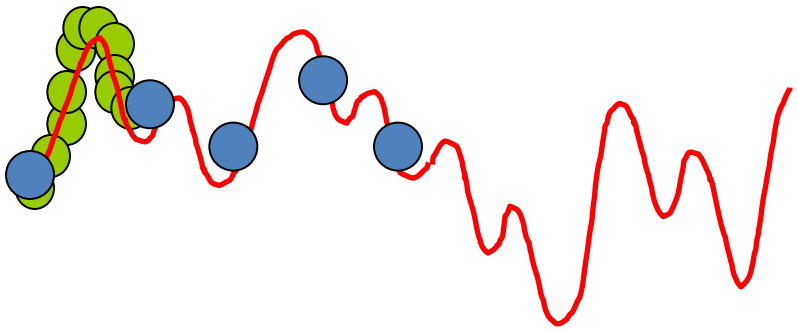
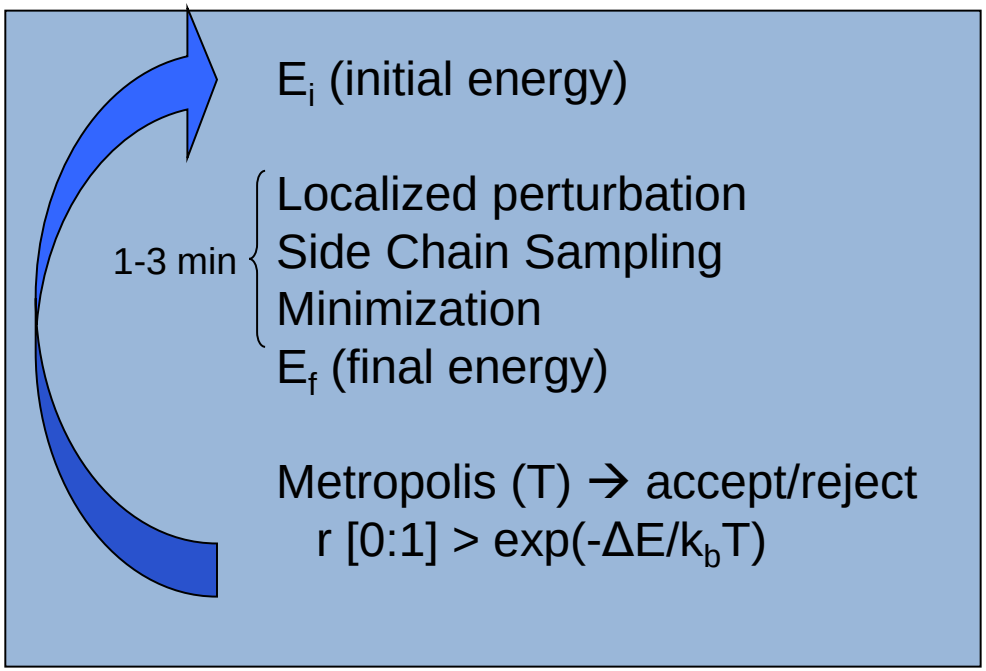
You collect what you input!



PELE: combining Monte Carlo with protein prediction algorithms

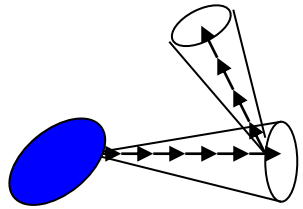


The algorithm (PELE):

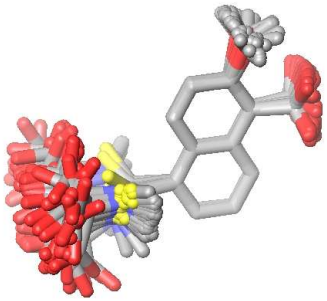


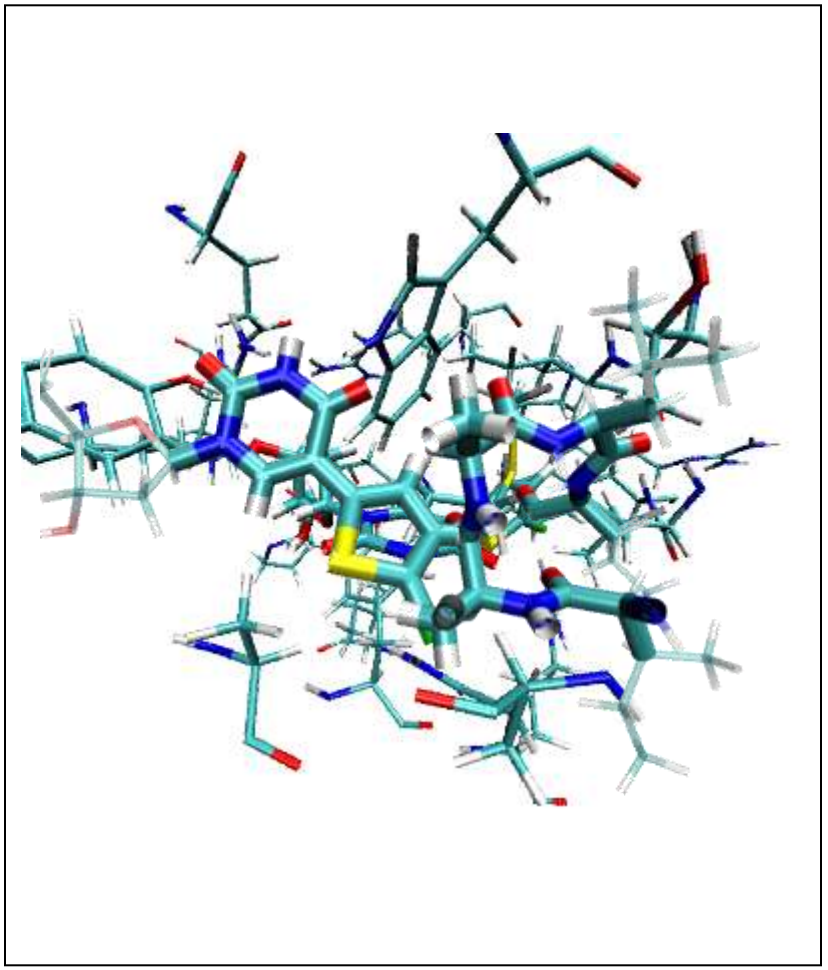
Borrelli KW, Vitalis A, Alcantara R, Guallar V. PELE: Protein Energy Landscape Exploration. A Novel Monte Carlo Based Technique. Journal of Chemical Theory and Computation. 1 (6): NOV 2005

Steered the perturbation



Ligand motion

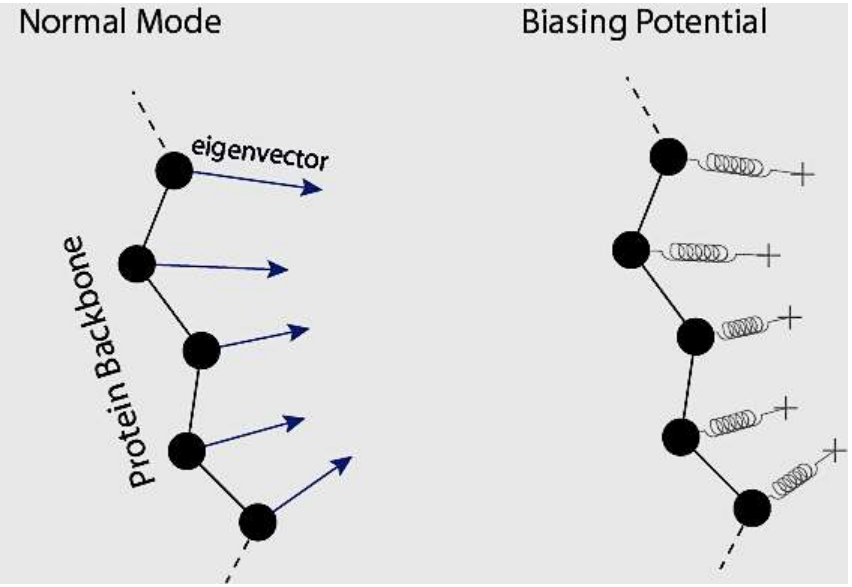




- Eliminate grid-points which always produce steric clashes (0.65% of VdW radius)
  - That create a steric clash between the ligand core and the protein sidechain
  - For which all the rotamers of a single residue or ligand region cause a steric clash with the backbone or ligand core
  - For which a single combination of rotamers cannot be found that does not produce a steric clash

Backbone Perturbation: Anisotropic Network Model
Follow a mode in an steered minimization

This ligand perturbation is coupled to backbone motion by means of a gaussian network of alpha carbon contacts



Side Chain Step (Prediction)

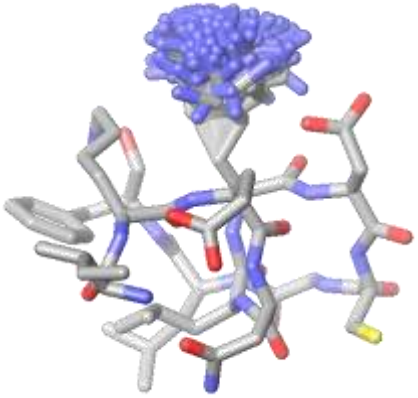
Rotamer Libraries (Barry Honig 2001) Define All Possible Residue Movements

Steric Filtering Removes Unfeasible Ones

Resulting Rotamers are Clustered

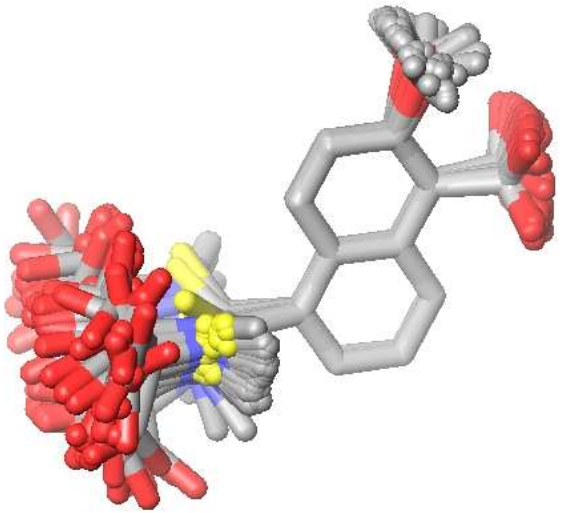
Clusters are Minimized

Lowest Energy Cluster is Selected



The Ligand also has rotamers associated!!

- Choosing a "core" region
  - The frozen region (no rotatable bonds within the region) that minimizes the number of bond lengths from this region to the farthest atom
- Populate the Library
  - Using Macromodel: eliminating all those that create a steric clash (two atoms closer than 75% of their combined VdW distance)



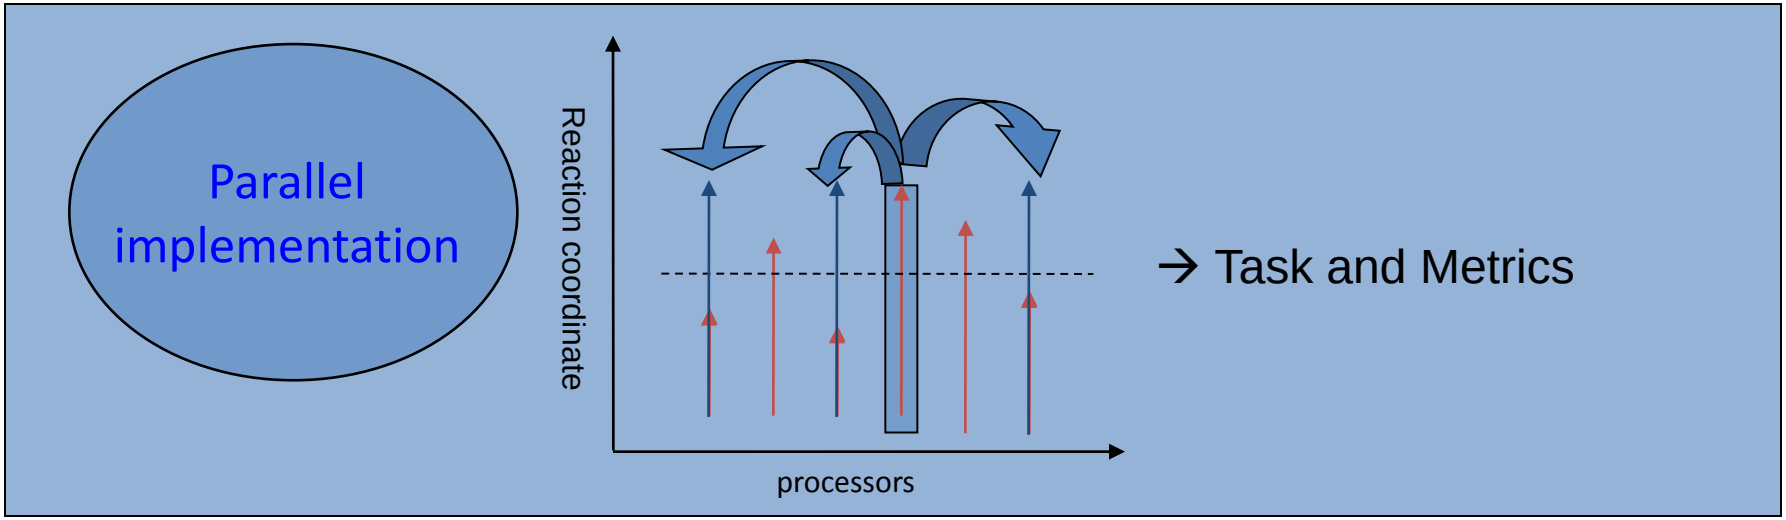
3 independent rotamers

Last step: minimization

Truncated Newton with long/short range force update and numerical born alpha derivatives

Alpha carbon can/should be constrained to the outcome of ANM

All rap up in MPI (parallel implementation: one node controlling and n-1 running)



Tasks: lower energy, binding energy, move ligands away/to, move domains, change initial rmsd, etc.

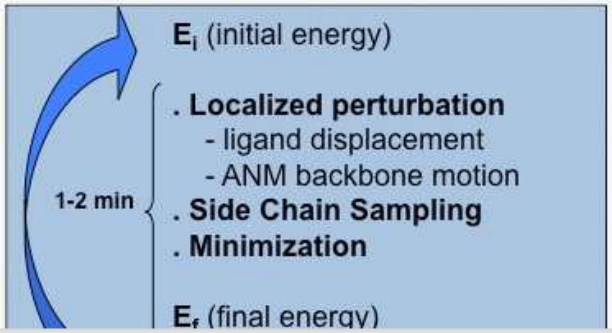
About PELE

Using technological advances in protein structure prediction, we have developed ***PELE*** (an acronym for Protein Energy Landscape Exploration), a novel method to perform protein energy landscape explorations. ***PELE*** combines a Monte Carlo stochastic approach with protein structure prediction algorithms and is capable of accurately reproducing long time scale processes in only few hours of CPU.

Figure below shows the heuristic algorithm for the landscape exploration method which is based on three main steps: *an initial perturbation*, *a side chain sampling* and a *final minimization*.



First thing: Ligand and protein check!

- Check Protein, missing loops, side chain...
- Ligand need to have unique atom names!
- Check protonation state, **read literature**!
- It needs to be one ligand (not composition of different ones...) → unique ligand number, name..

- Run the Protein Wizard of Maestro but check interactively each hydrogen bond, ligand, etc!!!
